

Charge Expressions

Making charge quantities
smarter and more flexible

What Are Expressions?

- Adjust the quantity value of a charge after it's calculated
- Enable complex charge quantity calculations
- Example: `quantity * 2` → doubles the calculated quantity

Syntax Basics

- Variables: names like `quantity`
- Functions: keywords with parentheses, e.g. `sum(...)`
- Operators: `+` `-` `*` `/` `()` follow normal math rules

Variables

- Properties added by the tariff calculation process
- Currently supported: `quantity`
- Example:
 - Charge type: `TotalDistance`
 - Expression: `quantity / 2`
 - If `distance = 25` → `result = 12.5`

Functions Overview

- Predefined operations you can use:
- `max()` → largest value
- `min()` → smallest value
- `sum()` → adds values
- `avg()` → average
- `pow()` → power
- `sqrt()` → square root
- `round()` → round to decimals
- `roof()` → round up
- `floor()` → round down
- `clamp()` → restrict between limits
- `size()` → get dimension value
- `ext()` → get custom property

Examples in Action

- `sum(5, 10, 15)` → 30
- `round(12.345, 2)` → 12.35
- `pow(2, 3)` → 8

How to use expresson

01

Navigate to Settings

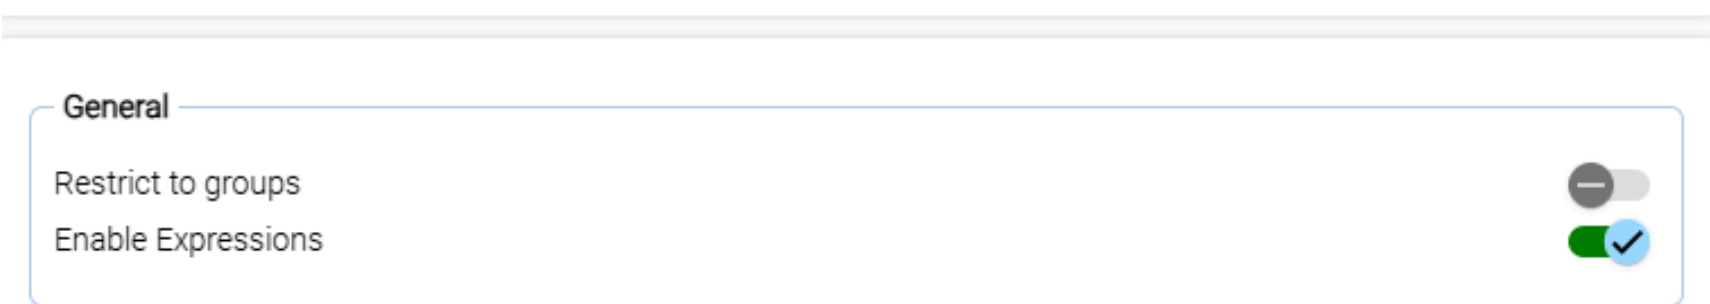

Navigate to settings → tariff engine

02

Enable expressions

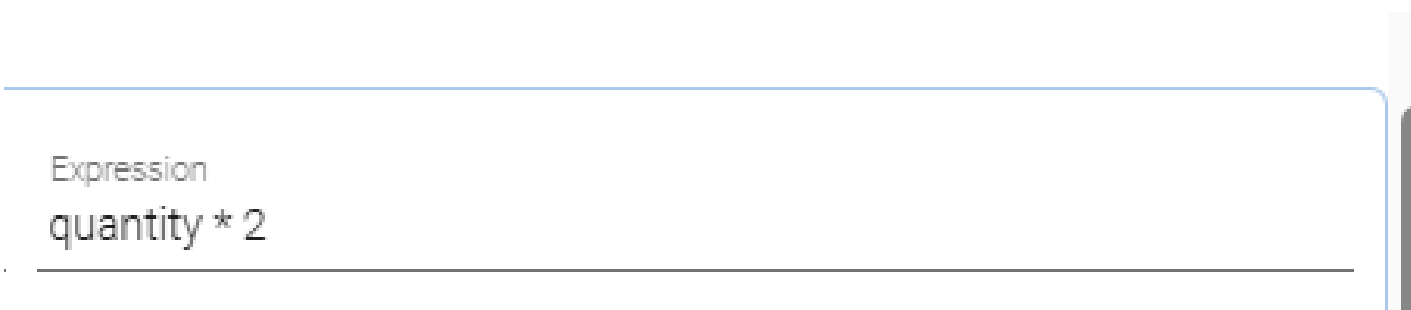

Enable the expressions funcationality

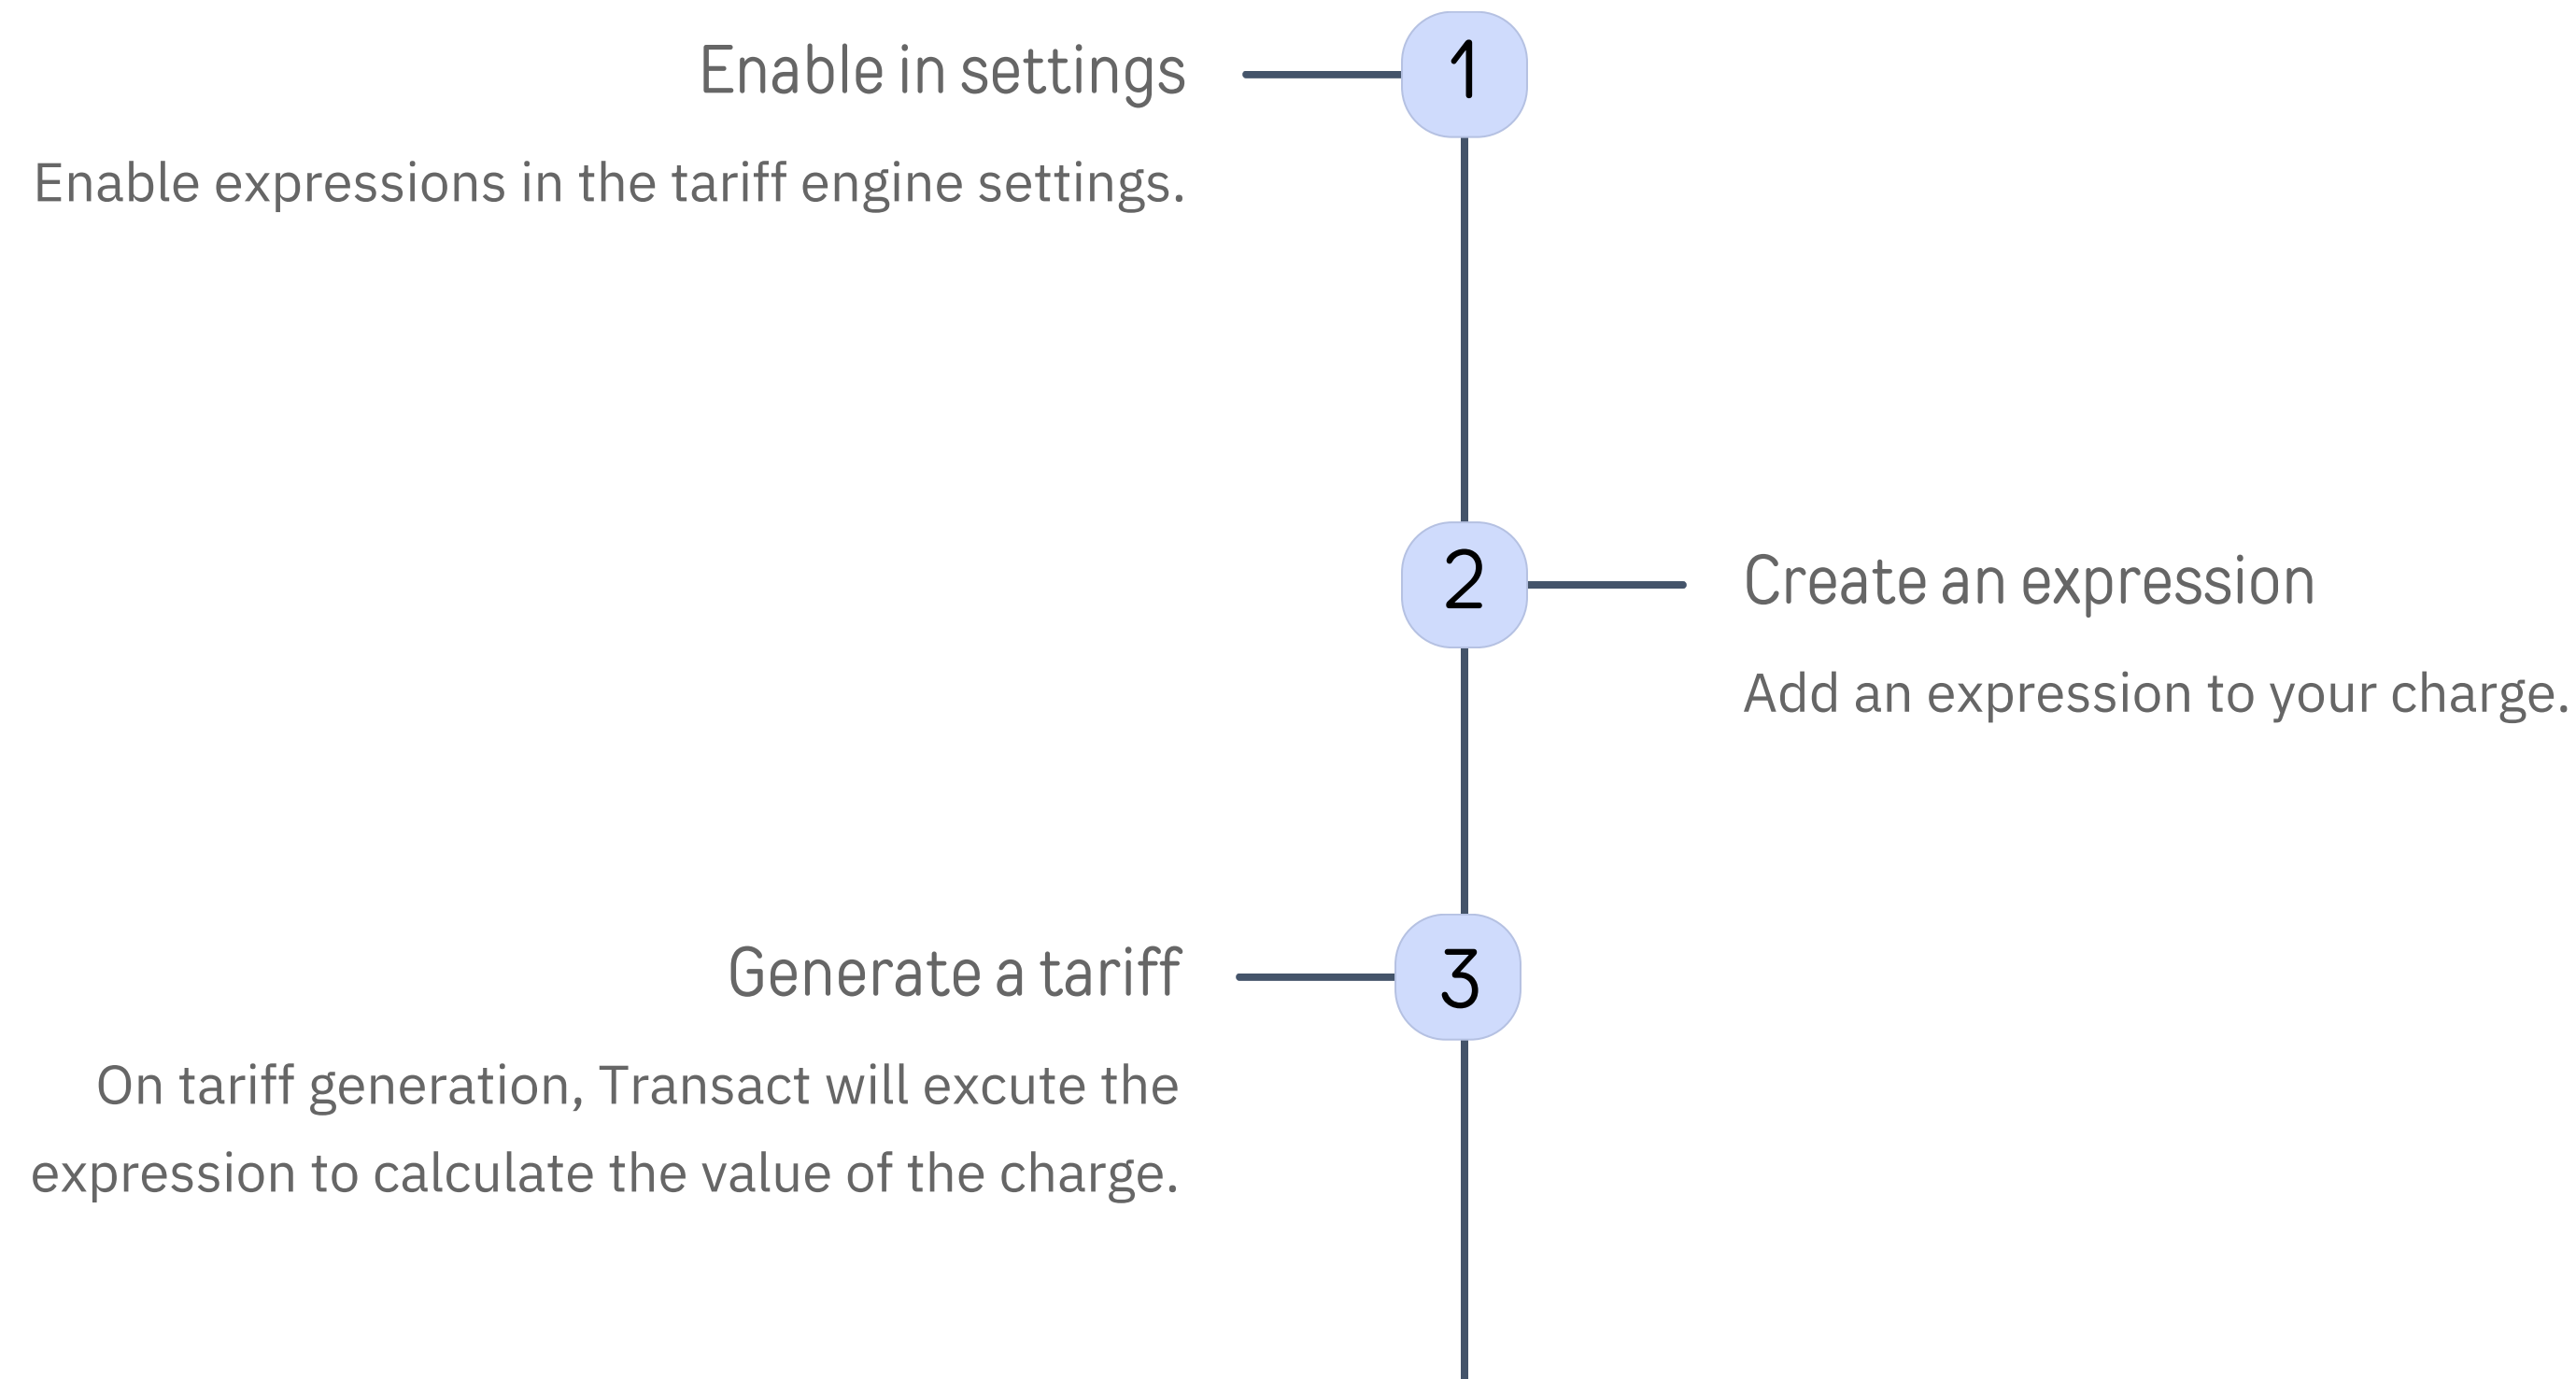

03

Add expressions to your charge

Add an expression to your charge within the expressions field.

Expression process

Key Benefits

1

Flexibility in Calculations

Expressions let you go beyond simple charge types. You can adjust values with formulas, making it easy to tailor calculations to different business rules or scenarios

3

Consistency and Accuracy

Expressions ensure that calculations follow the same rules every time. Instead of manually adjusting charges, the system applies the formula automatically, reducing errors and saving time.

2

Smarter Tariff Management

By combining variables and functions, you can handle complex tariff logic without needing custom code. This makes your tariff engine more powerful and adaptable

4

Greater Control for Users

You decide how charges are calculated. Whether it's rounding, clamping values within limits, or applying averages, expressions give you direct control over the outcome.
