

Configurable Trip Validations

New tools to give you
precise control over trip
planning rules and
enforcement

Take Control of Your Trip Rules

We've introduced powerful new configurable validations that put you in the driver's seat when building trips. These smart validations give you the flexibility to determine which operational rules should act as hard blockers versus helpful warnings.

This means you can now customize your planning workflow to match your organization's specific needs and priorities, ensuring critical rules are always enforced while maintaining flexibility where it matters most.

Trip custom validation

Extend trip with custom validation

Overloading

Trip exceeds vehicle + trailer capacity constraint i.e. vehicle utilization > 100%

☒ Block ☐ Warning

Attribute Restriction Validation

There are any attribute or restriction violations

☒ Block ☐ Warning

Overlapping Trips

If the vehicle assigned causes an overlapping trip violation.

☒ Block ☐ Warning

Regulatory Permits

If any allocated entity has invalid permits.

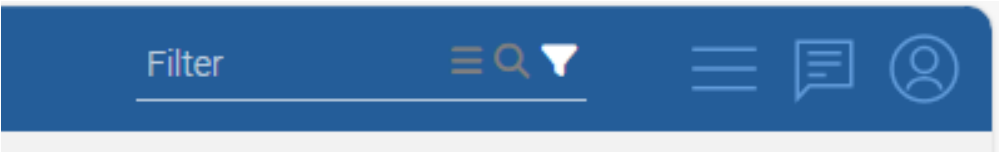

☒ Block ☐ Warning

How to Configure Your Validations

01

Navigate to Settings

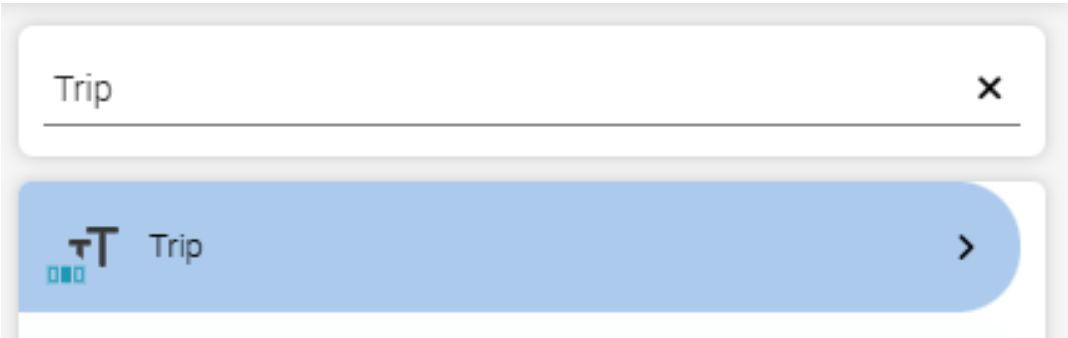

Open your Settings menu from the main navigation

02

Search for Trip Entity

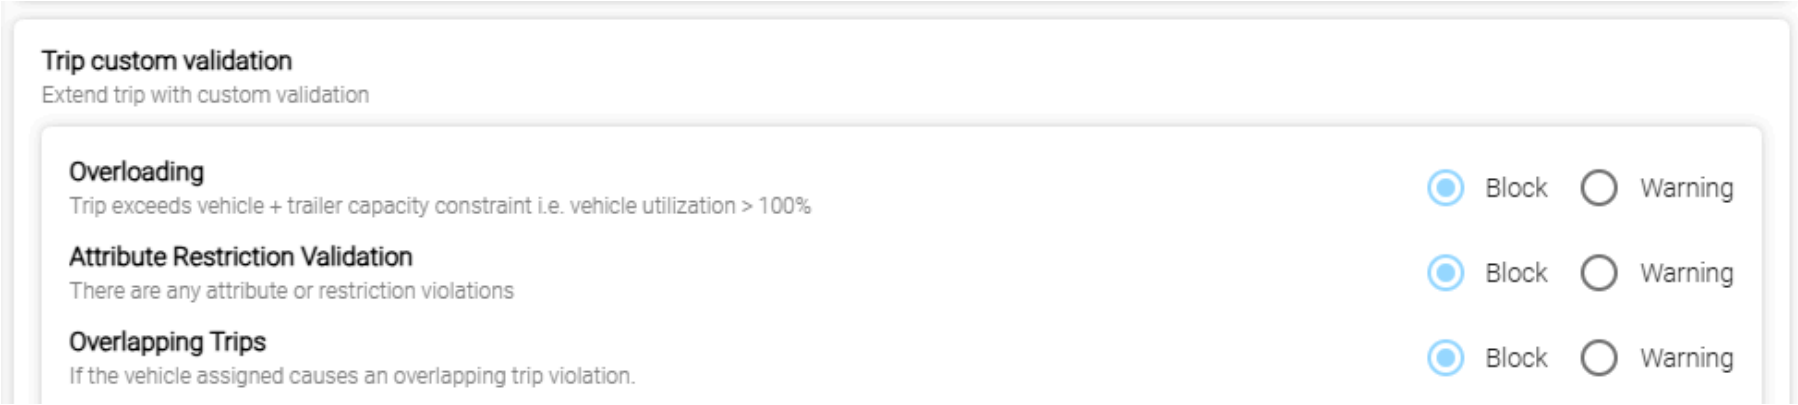

Use the search function to quickly locate the Trip configuration

03

Configure Validation Rules

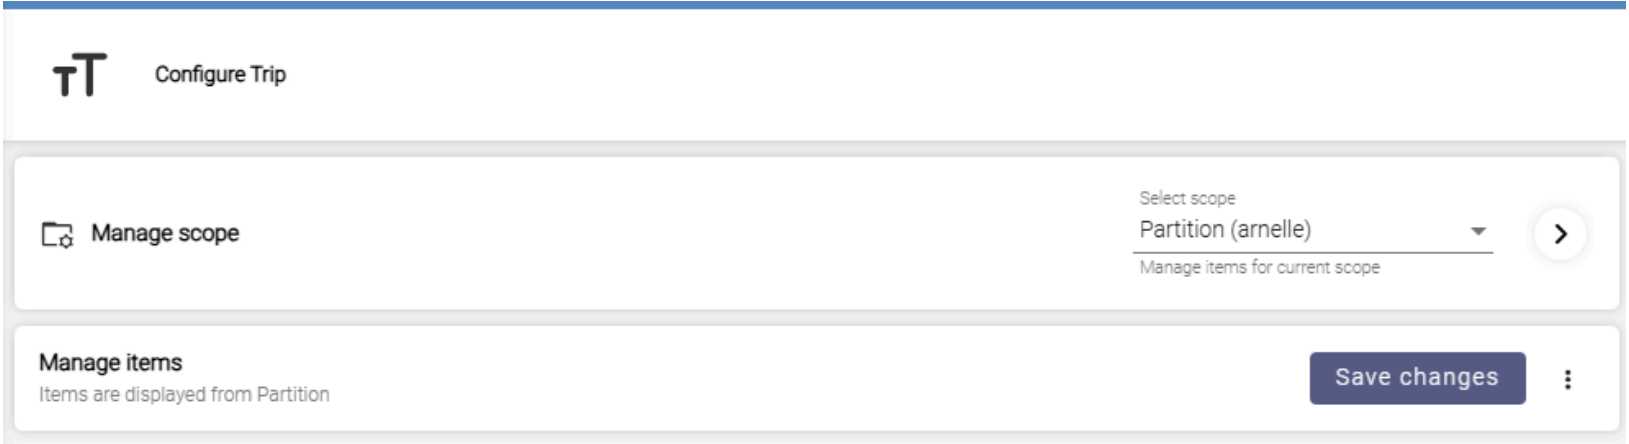

Select your preferred enforcement level for each validation type

04

Save Your Settings

Apply your configuration to activate the new validation rules

Three Validation Types Available

Each validation type helps protect different aspects of your trip planning workflow

Trip Overloading

Prevents trips from exceeding vehicle capacity limits, ensuring safe and compliant operations

Trip Attribute & Restriction Violations

Ensures trips follow all configured attributes and restrictions you've established

Overlapping Trips

Checks that trips don't conflict with other scheduled trips on the same vehicle

Two Enforcement Levels

Blocked

When a rule is broken, the trip cannot be planned or committed. This is a hard stop that requires resolution before proceeding, ensuring critical operational requirements are never violated.

Use Blocked for:

- Safety-critical capacity limits
- Regulatory compliance requirements
- Legal restrictions that cannot be violated
- Vehicle availability conflicts

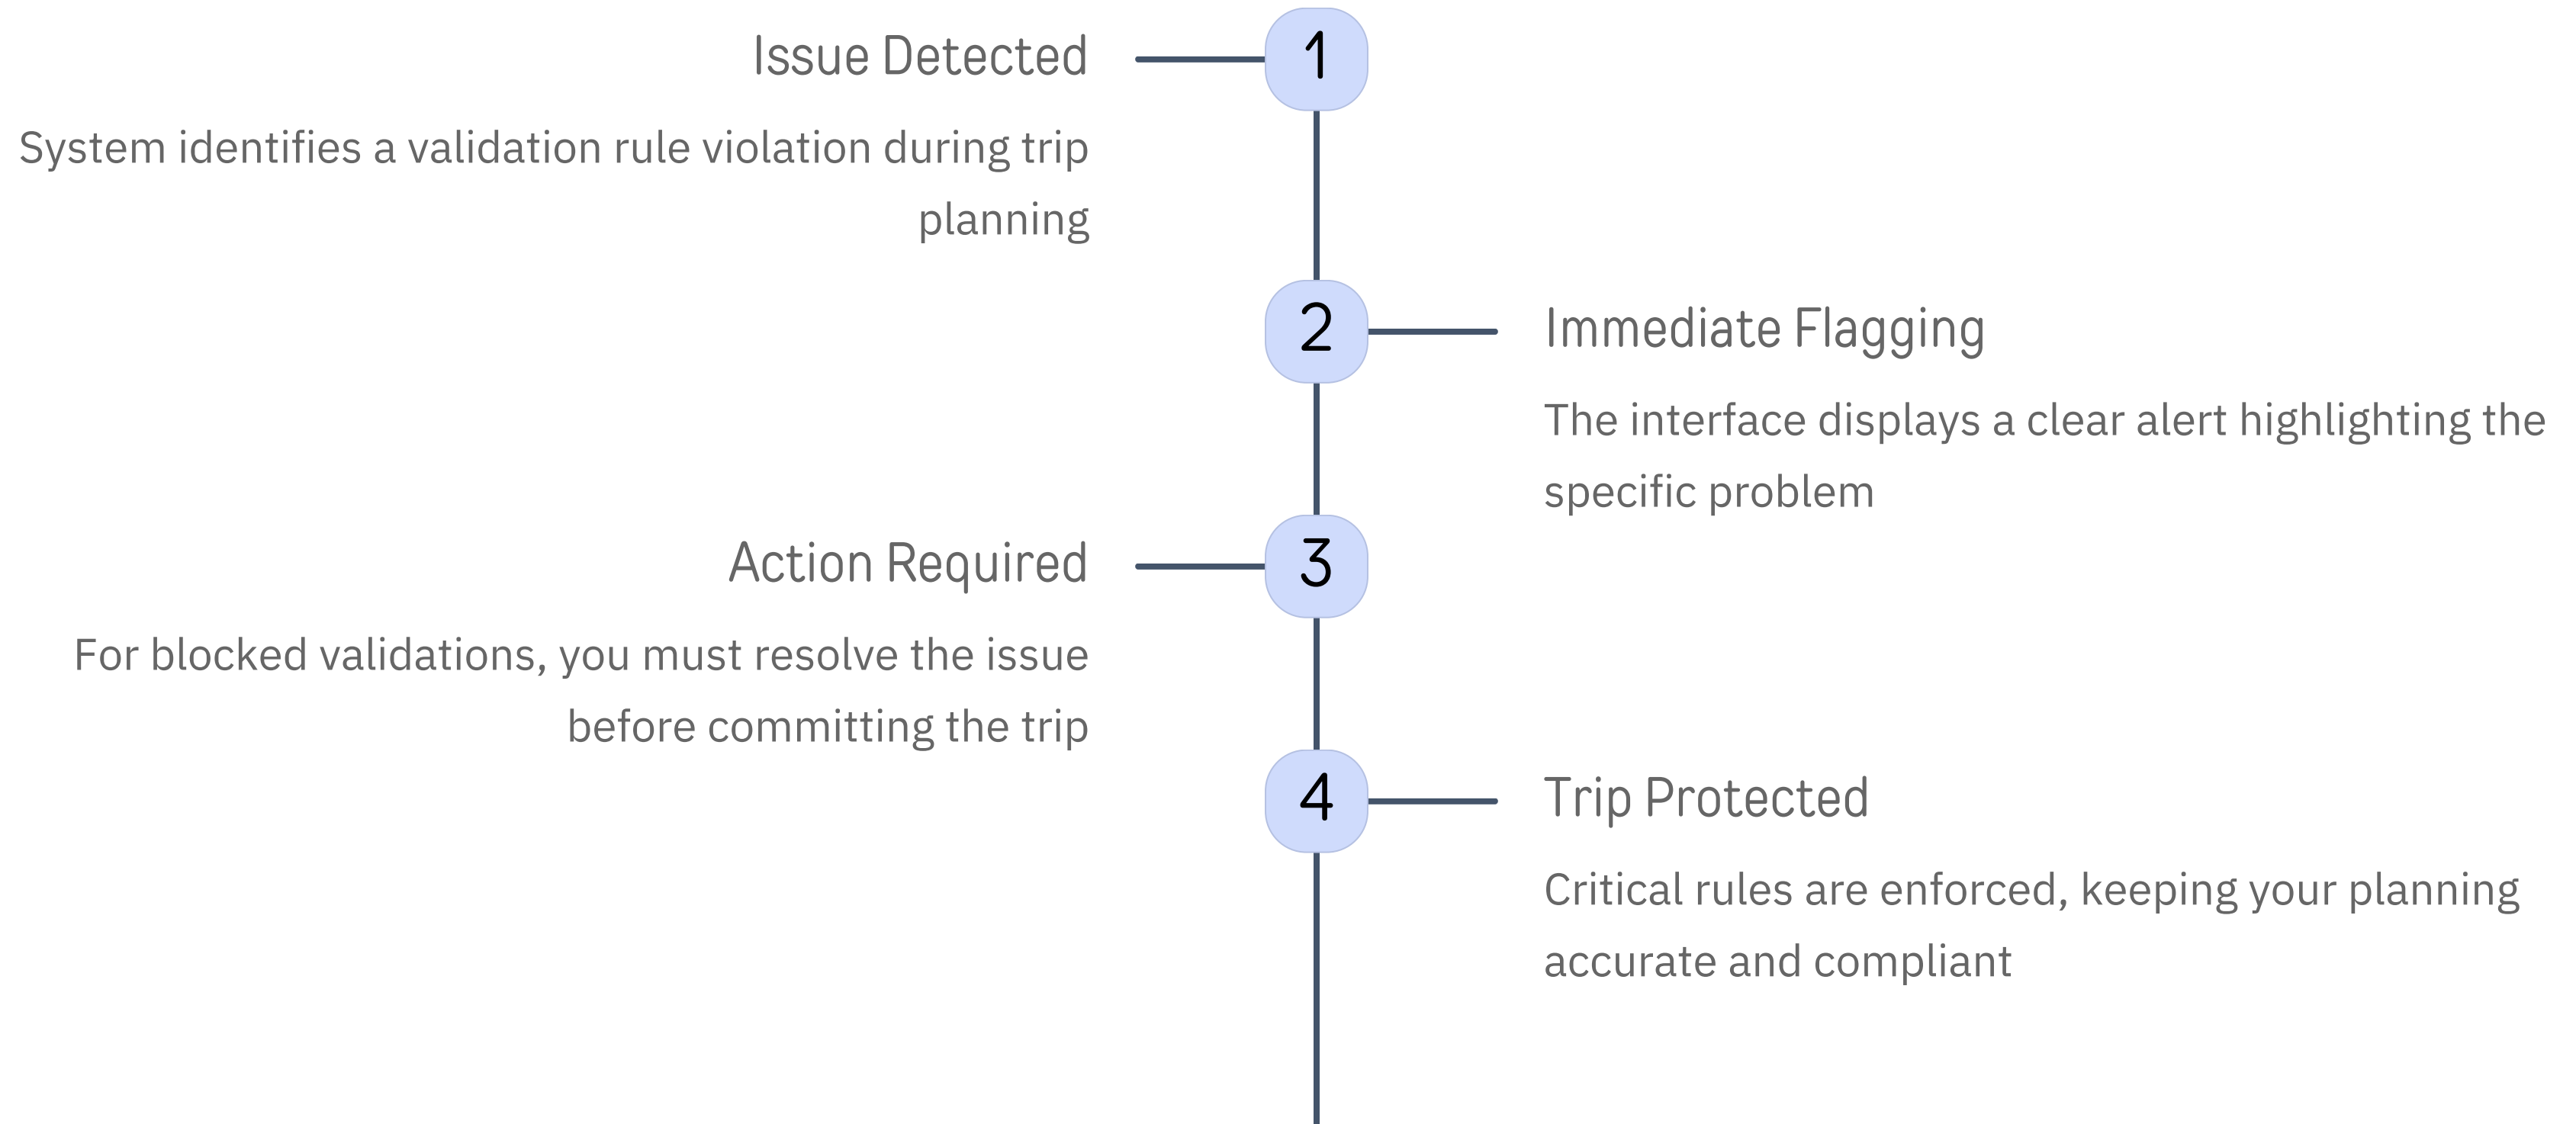

Warning

The trip can still be planned and saved, but the system displays a clear notification alerting you to review the potential issue. This provides visibility while maintaining workflow flexibility.

Use Warning for:

- Efficiency recommendations
- Cost optimization suggestions
- Non-critical operational preferences
- Informational best practices

What Happens When Rules Are Broken

Key Benefits

1 Enhanced Compliance

Ensure critical operational and regulatory requirements are always met with automated enforcement of blocked validations

3 Improved Accuracy

Catch potential issues in real-time during the planning process, reducing errors and costly corrections later

2 Workflow Flexibility

Maintain planning efficiency by using warnings for non-critical rules, allowing planners to make informed decisions

4 Customizable Control

Tailor validation rules to match your organization's specific operational needs and priorities
