

Dimension Configurations

Min/Max Validation:
Keeping Your Data Within
Bounds.

Dimension limits

The Dimension Min/Max Validation feature allows administrators to set an optional minimum and maximum value for any dimension in Tramm, ensuring only valid numbers can be entered. Once configured, these limits are enforced everywhere that dimension appears for user input across the entire platform. This prevents incorrect, unrealistic, or non-compliant values from being saved, helping maintain clean, accurate, and consistent data. By stopping invalid entries at the source, the feature improves data integrity and strengthens overall reporting quality.

How to Configure Your Dimensions

01

Navigate to Settings

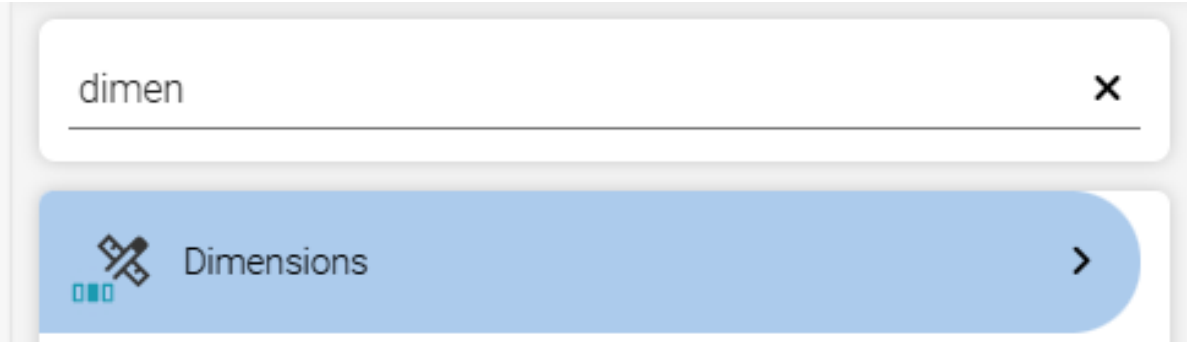

Open your Settings menu from the main navigation

02

Search for Dimension

Use the search function to quickly locate the Dimensions setting

03

Configure Min & Max limits

Select your dimension and add in min max limits

Id*		Name*	Unit
mass		Mass	kg
Description			
mass in kgs			
Min		Max	
100		8000	

04

Save Your Settings

Update or commit your configuration to activate the new limits.

Min & Max limits

Configuration settings apply as follows

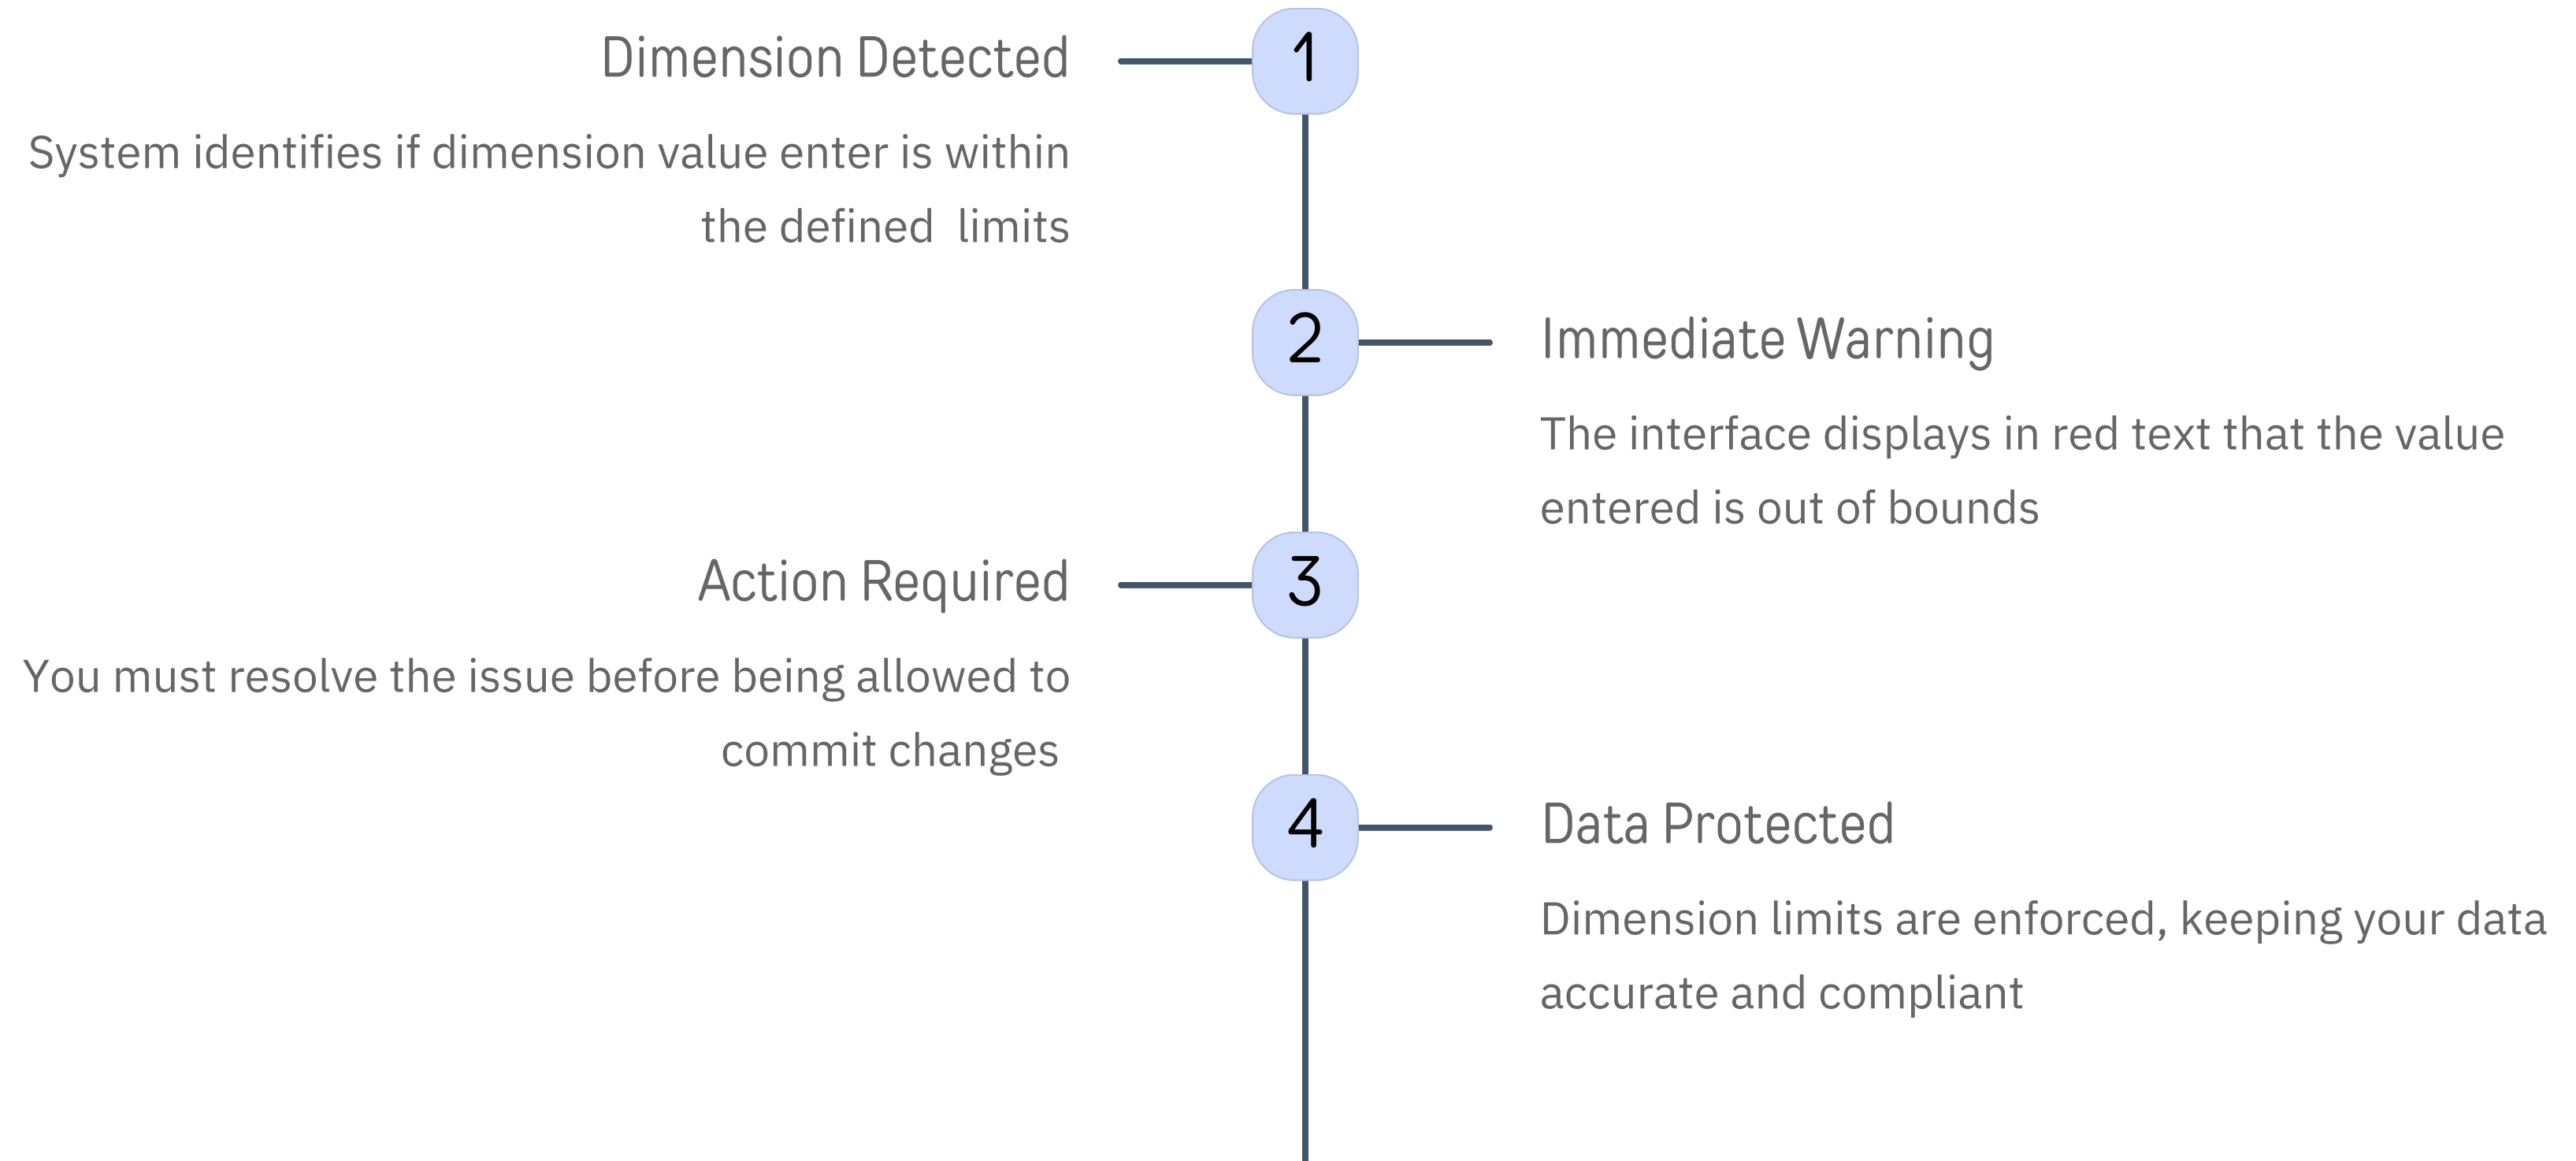

Minimum

Lower limit of the range. Any value lower than what's set will not be valid. The value itself is a valid number.

Maximum

Upper limit of the range. Any value above what's set will not be valid. The value itself is a valid number.

What Happens When Limits Are Broken

Key Benefits

1

Cleaner Data

Prevents invalid or out-of-range values at the point of entry.

3

Consistency

Ensures all users follow the same numeric rules across the platform.

2

Less Rework

Reduces downstream corrections, saving time and effort.

4

Better Reporting

Reliable inputs lead to more accurate analytics and insights.
