

Licence and Permit Validation

This feature ensures that all transporters, vehicles, and operators have valid permits and licences before trips are created. It helps planners maintain compliance and avoid scheduling issues.

Maintain compliance

This feature ensures that all transporters, vehicles, and operators have valid permits and licences before trips are created. It helps planners maintain compliance and avoid scheduling issues.

Settings

1 Expiry Warnings

Set the number of days before expiry to trigger a warning. Go to Permit Settings and enter the warning threshold.

The screenshot shows the 'Regulatory Permit Configuration' settings page. The top header includes the user profile 'Arnelle Roux' and a 'Log out' button. The sidebar on the left has a search bar with 'perm' and a menu item 'Regulatory Permit Configuration' which is currently selected. The main content area is titled 'Defines the configuration for the regulatory permits' and features a 'Warning Threshold Days' section. This section has a text input field labeled 'Number of days' with the value '10' entered, and a dark blue 'Update' button at the bottom.

2 Validation Behaviour

Configure how the system reacts to invalid permits. Navigate to Trip Entity Settings. Choose whether to block trip creation or just show a warning.

The screenshot shows the 'Trip custom validation' settings page. The title is 'Trip custom validation' with a subtitle 'Extend trip with custom validation'. Below this, there are four validation rules, each with a description and two radio buttons for the action: 'Block' (selected) and 'Warning'.

Validation Rule	Action
Overloading Trip exceeds vehicle + trailer capacity constraint i.e. vehicle utilization > 100%	☒ Block ☐ Warning
Attribute Restriction Validation There are any attribute or restriction violations	☒ Block ☐ Warning
Overlapping Trips If the vehicle assigned causes an overlapping trip violation.	☒ Block ☐ Warning
Regulatory Permits If any allocated entity has invalid permits.	☒ Block ☐ Warning

Permit Setup

01

Navigate to vehicles, operators or transporters

Select a vehicle, operator and transporter or add a new entity.
Navigate to the permits section.

02

Add a permit or licence

- Permits can be set up for vehicles, operators, and transporters.
- Each can have multiple entries with:
 - Name
 - Description
 - Type
 - Validity Period
- You can enable or disable individual permits or all permits for an entity.

Operator(PermitOperator) has invalid permits

Commit

Close

Depending on settings, the system may block the action or allow it with a warning.

Validation available on three entities

Each validation can be enabled or disabled depending on your operational needs.

Transporters

Ensures validate permits or licenses for transporters.

Vehicles

Ensures validate permits or licenses for vehicles.

Operators

Ensures validate permits or licenses for drivers or assistants.

Two Enforcement Levels

Blocked

When a rule is broken, the trip cannot be planned or committed. This is a hard stop that requires resolution before proceeding, ensuring critical operational requirements are never violated.

Use Blocked for:

- Expired vehicle licence
- Drivers licence expired
- Dangerous goods permit
- Transporter operating license

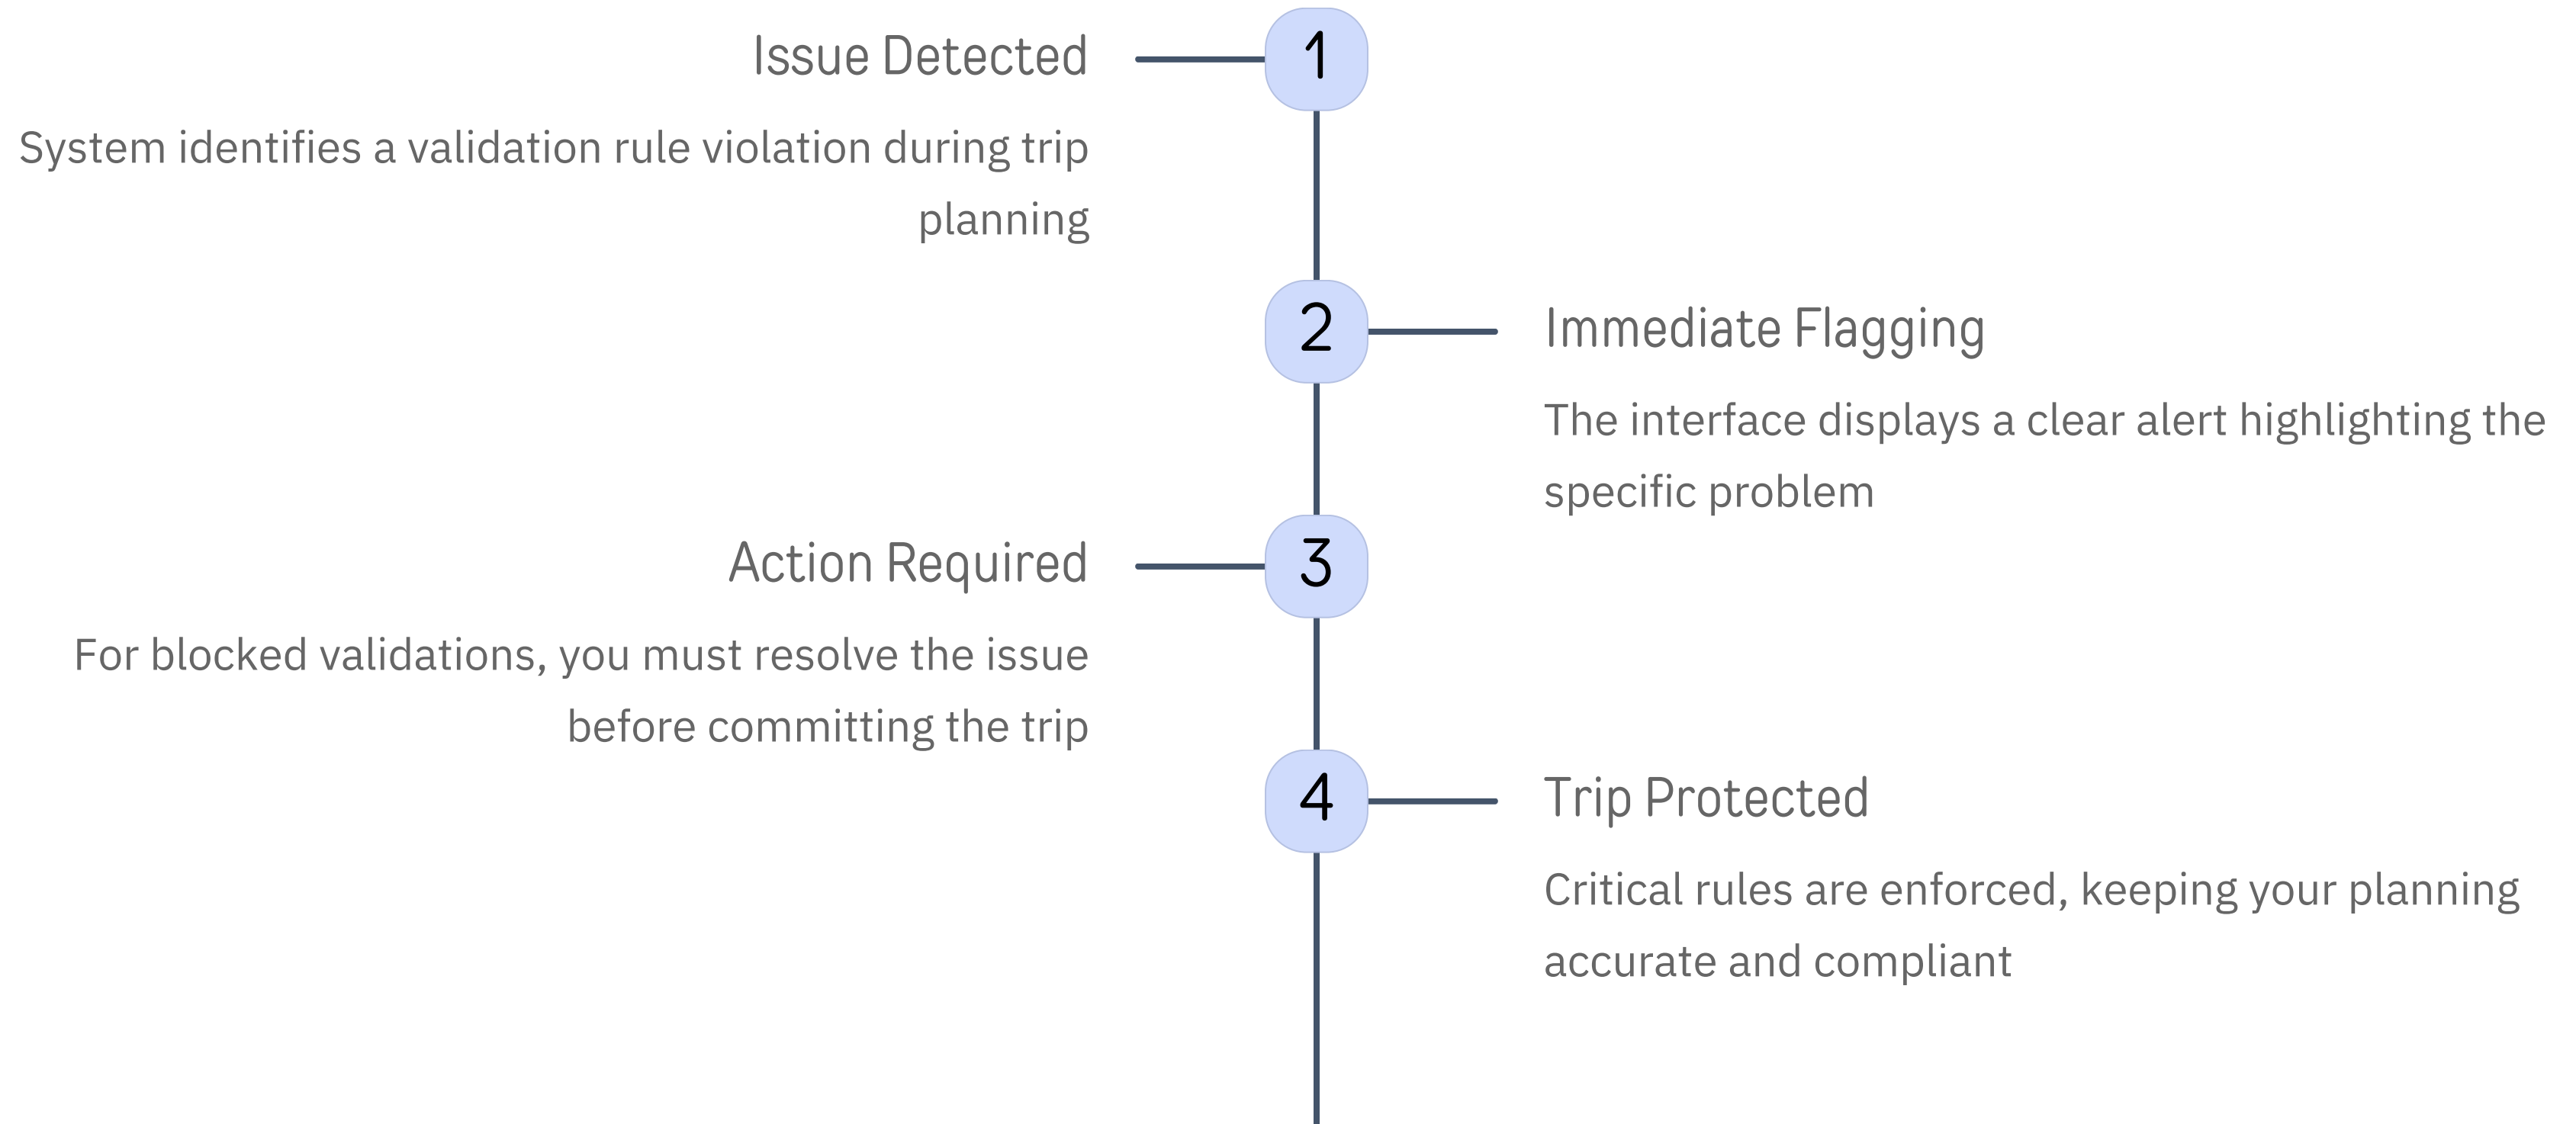

Warning

The trip can still be planned and saved, but the system displays a clear notification alerting you to review the potential issue. This provides visibility while maintaining workflow flexibility.

Use Warning for:

- Non-critical permit missing
- Informational permits/licenses

What Happens When Rules Are Broken

Key Benefits

1

Ensures Compliance

Automatically checks that all vehicles, operators, and transporters have valid licences and permits before trips are created.

2

Reduces Risk

Prevents scheduling trips with expired or missing documentation, avoiding fines, delays, or safety violations.

3

Improves Planning Accuracy

Real-time warnings or blocks help planners make informed decisions and avoid last-minute disruptions.

4

Confidence in Scheduling

Planners can build trips and reallocate resources knowing the system will flag any invalid permits.
