

Solver Settings

The new solver setting allows you to define a specific start and end date-time window that the solver must operate within.

Precise Planning Within a Controlled Time Frame.

This feature introduces a new solver feature that lets you define a specific start and end time for trip generation. This ensures all planned trips fall within your defined schedule, giving you tighter control over daily operations.

☐ Force Single Solve
☐ Try simplify model
☒ Use Selected Jobs
☐ Allow Splitting

☐ Split Trips at empty
☐ Split Stops at empty
☐ Remove Empty Legs
☒ Only Split at Homesite

☐ Use Fatigue Rules
☐ Solve per Depot
☐ Solve Per Day
☐ Disable Reloading

☐ Enforce stackability
☐ Stop on convergence
☐ Use Trip Actuals

Run the Solver

3 Solver options

Run the solver along with other desired option selected

Solve

4 Resulting Trips

When the solver runs, it treats this time range as a constraint.

All generated trips will start on or after the selected start time, and finish before the end time

Key Benefits

1

Controlled Trip Generation

Ensures all solver-generated trips fall strictly within your defined operating window.

3

Operational Efficiency

Helps streamline daily planning by focusing the solver on valid working periods only.

2

Improved Scheduling Accuracy:

Prevents trips from being created too early or too late, keeping plans aligned with real-world operations.

4

Greater Flexibility

Easily tailor the solver to match peak times, restricted hours, or specific operations with custom time ranges.
