

Configurable Trip Validations

Tariff validity: aligning rates
with real-world timelines.

Planned or Actual Validity Checks

Tariff validity provides organizations with the flexibility to define how and when tariffs are applied, ensuring that financial calculations are both accurate and aligned with operational realities. By configuring validity checks at either the trip level or the job level, businesses can choose whether to base tariffs on planned schedules or actual recorded times.

This adaptability allows for precise validation against start times, end times, or full activity windows, giving teams confidence that the right charges are applied to the right periods. Ultimately, tariff validity helps streamline billing, reduce errors, and maintain consistency across diverse operational scenarios.

Planned Window

Uses the planned start and end times of the job (activity).

Actual Window

Uses the actual start and end times of the job (activity).

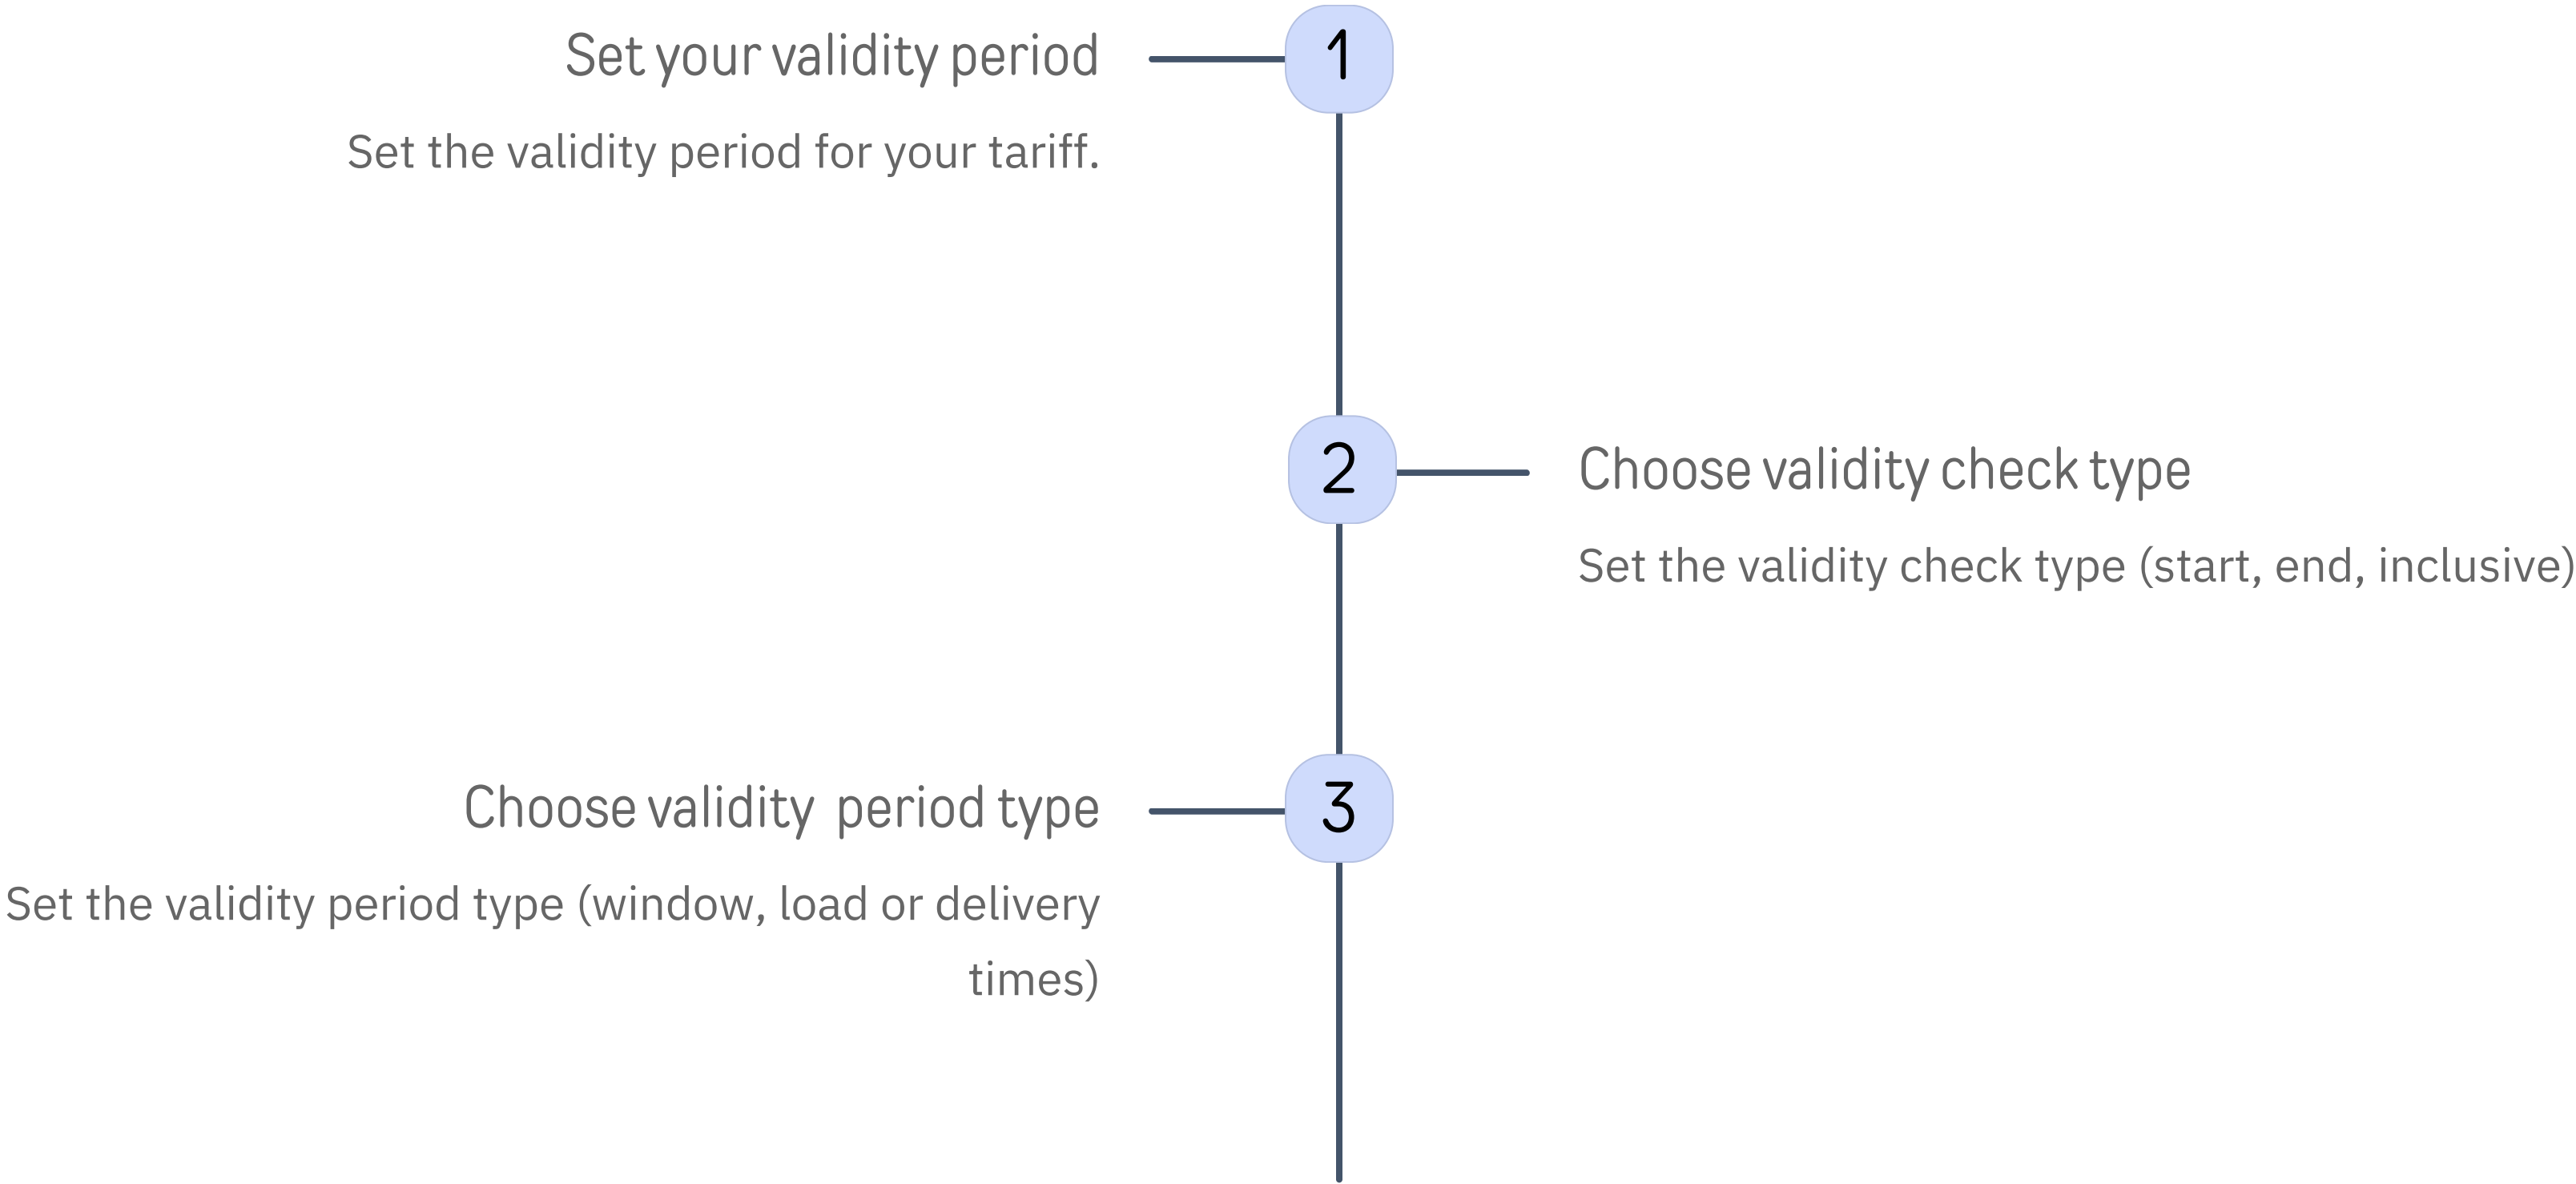

Loaded Times

Uses either planned or actual load activity times.

Delivery Times

Uses either planned or actual delivery activity times.

Setup Tariffs

Key Benefits

1 Accuracy in Financial Calculations

Tariffs are applied to the correct time periods, ensuring billing reflects actual or planned operations and reducing costly errors.

3 Operational Alignment

Matches tariffs to real-world events, whether scheduled or recorded, so financials stay aligned with operational realities.

2 Flexibility in Configuration

Supports both planned and actual time windows, allowing businesses to adapt tariff checks to different operational scenarios

4 Transparency and Compliance

Establishes clear rules for when tariffs apply, supporting contractual obligations and simplifying audits.
