

Trip Locking

From creation to completion, trip locking ensures consistent behavior, clean data, and protected records throughout the trip lifecycle.

Smart Locks for Stable, Reliable Trip Data

Trip Locking in Tramm gives you precise control over when trip data can no longer be edited or moved to a different state. By defining your locking rules up front, you ensure that finalized or inactive trips remain stable, tamper-proof, and compliant with operational standards.

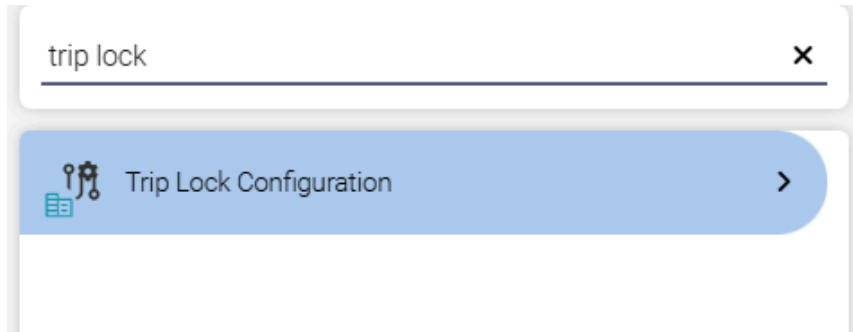

Setting up your configuration

- 1

Configuration

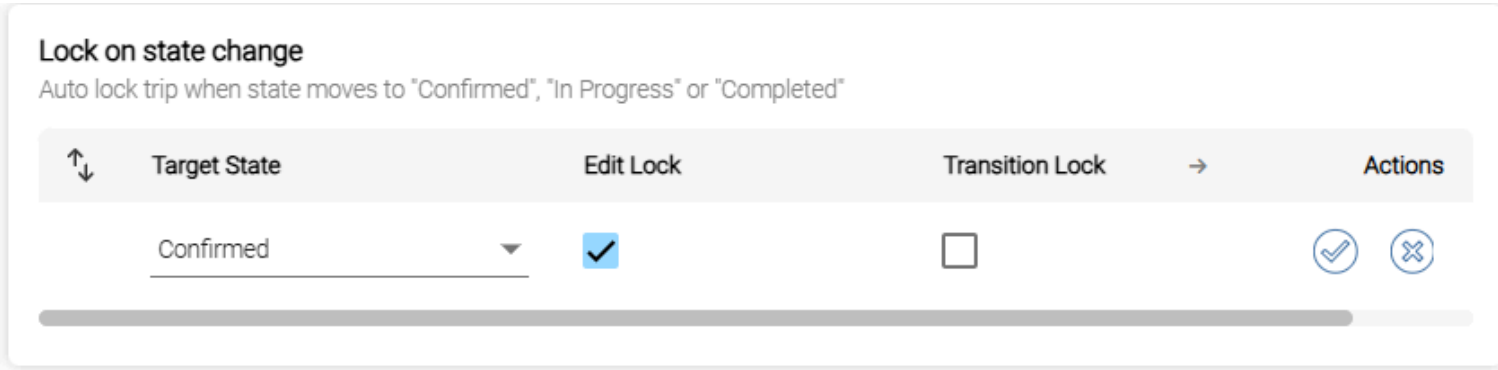

Search for Trip Lock Configuration in settings

- 2

Lock on change state behaviour

Configure which target from which state the trip will be locked. Chose to Lock edits on trip or transitions on trip or both.

Setting up your configuration

3

Time based Lock

Trips can be locked based on time last updated. Set the number of days after last edit. Chose to Lock edits on trip or transitions on trip or both.

Time based lock
Lock trip after certain amount of days from last update. Lock will be attempted at 00:00am every day.

Lock after - days

90

☒ Edit lock

☒ Transition lock

5

Save setting

Set scope and click update for trip lock to be enforced.

 Manage scope

Two Triggers For Locking

One or both levels can be set up for trip locking.

Edit Lock

When the trip state enters the defined lock state. The states available for locking are Confirmed, In Progress and Completed

Time-based

Define the age threshold (e.g. 90 days since last edit). This enables automatic locking for older, inactive trips. Lock occur every night at 00:00am

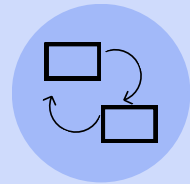

Two Lock Actions Available

One or both actions can be set up for trip locking based operational needs

Edit Lock

Ticking this option will not allow the actions to make any more changes to the trip. The edit buttons on the under interface will not be available for you.

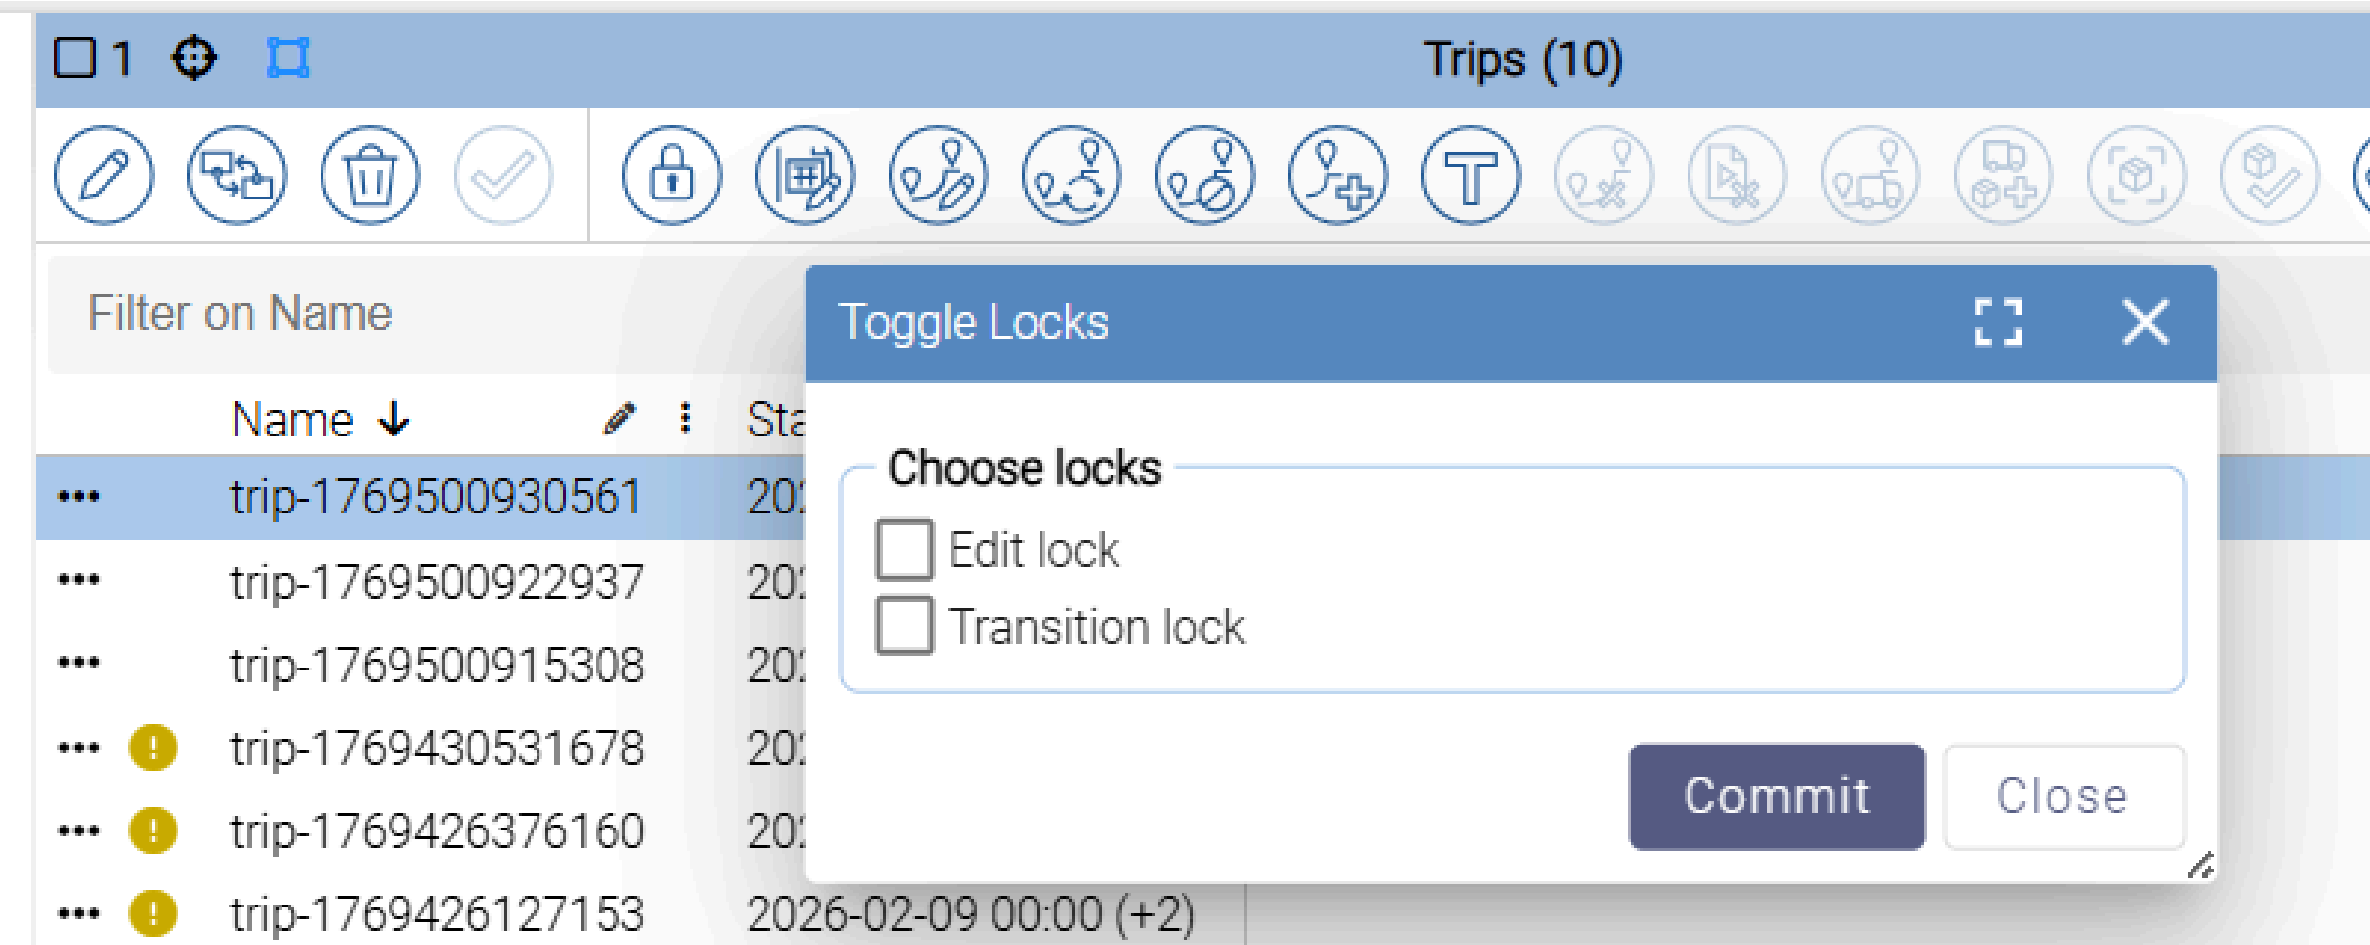

Transition Lock

Choosing this option will not allow the trip state to progress further than its locked state. Additionally custom state action will be not available on the interface.

Setting Super User Lock Override

To give flexibility where needed, overriding a lock is controlled through user roles. The permission to toggle or bypass trip locks can be assigned to a user. This permission is typically reserved for higher-level users — such as super users or managers — ensuring only authorized people can unlock and make changes when necessary

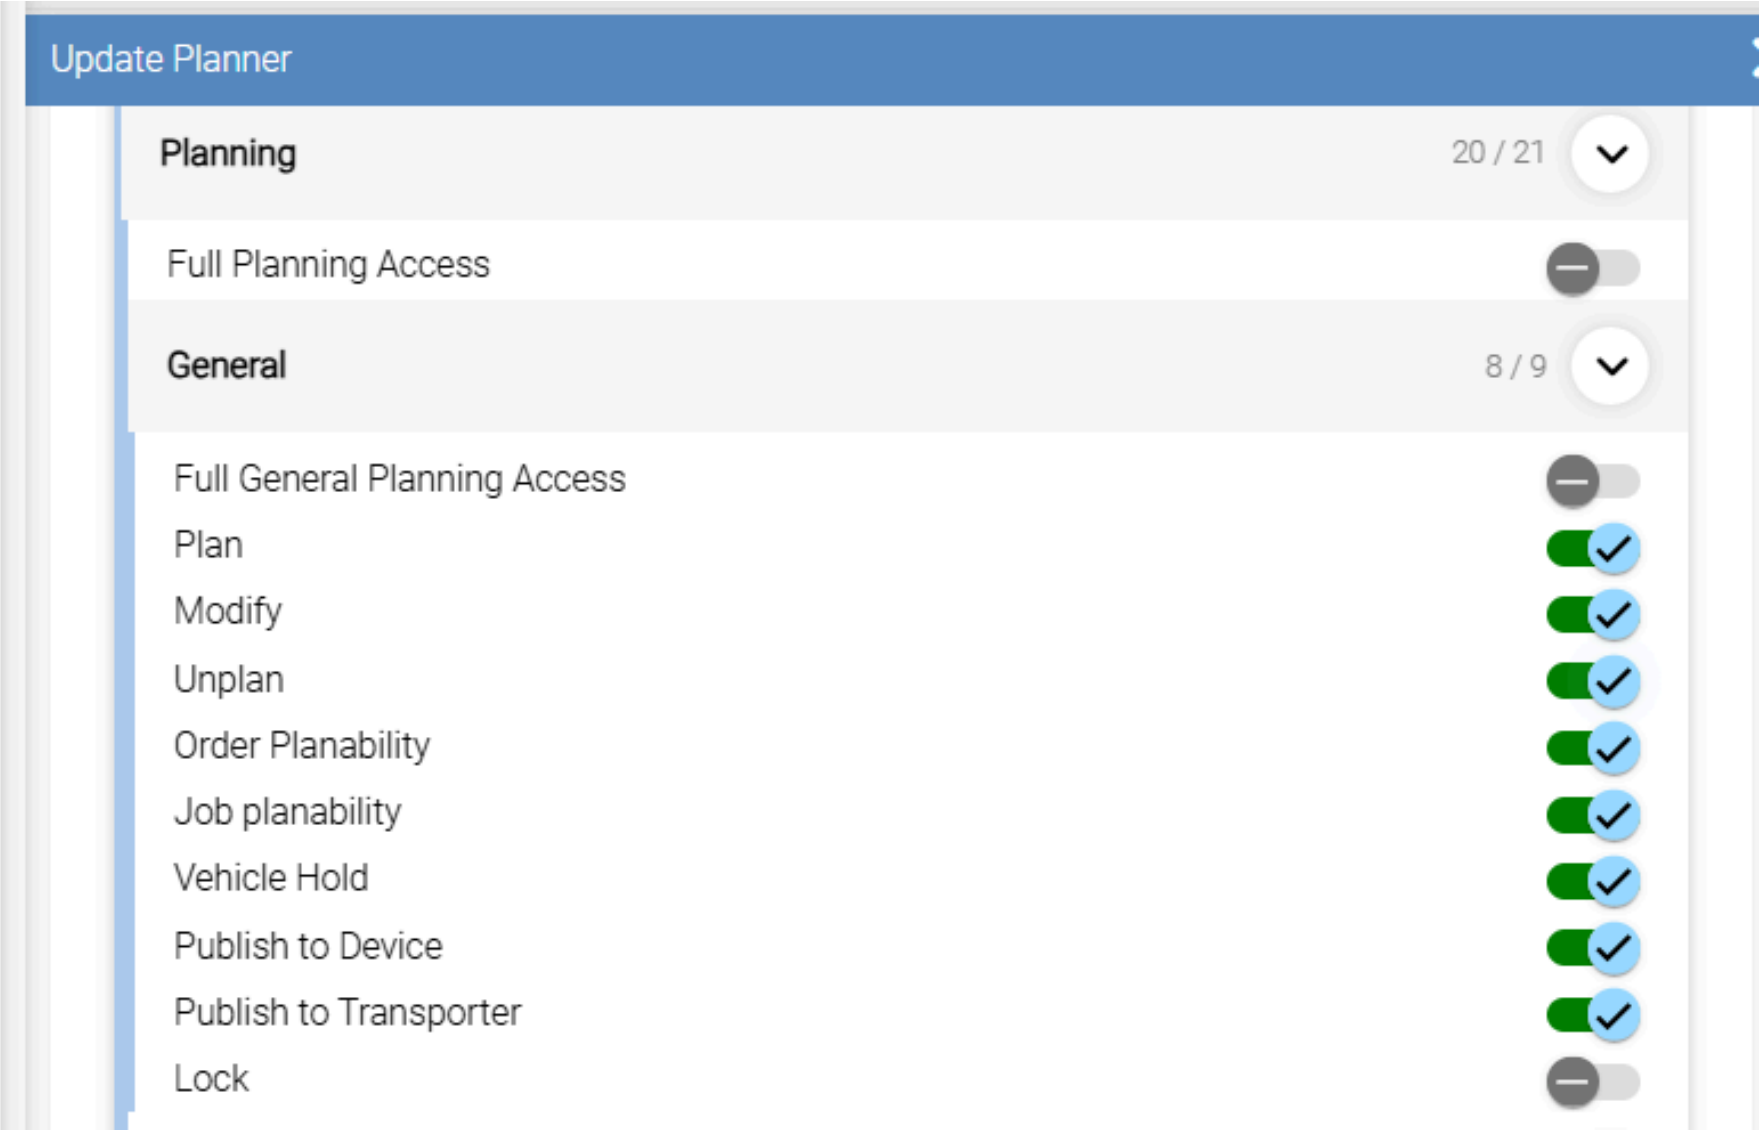

Setting up your super user

01

Navigate to Settings > User Roles

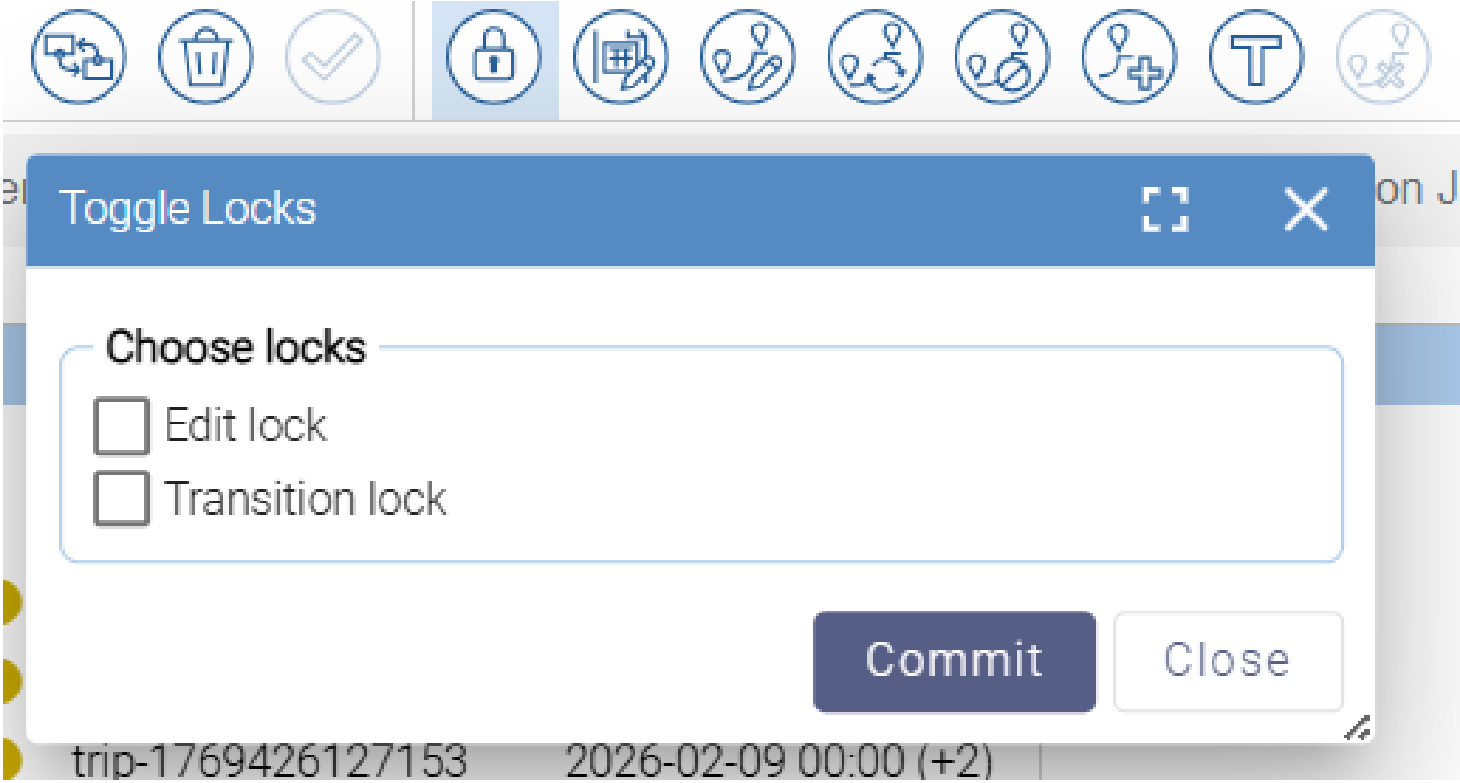

Under Actions, in the General section, turn on the Lock option

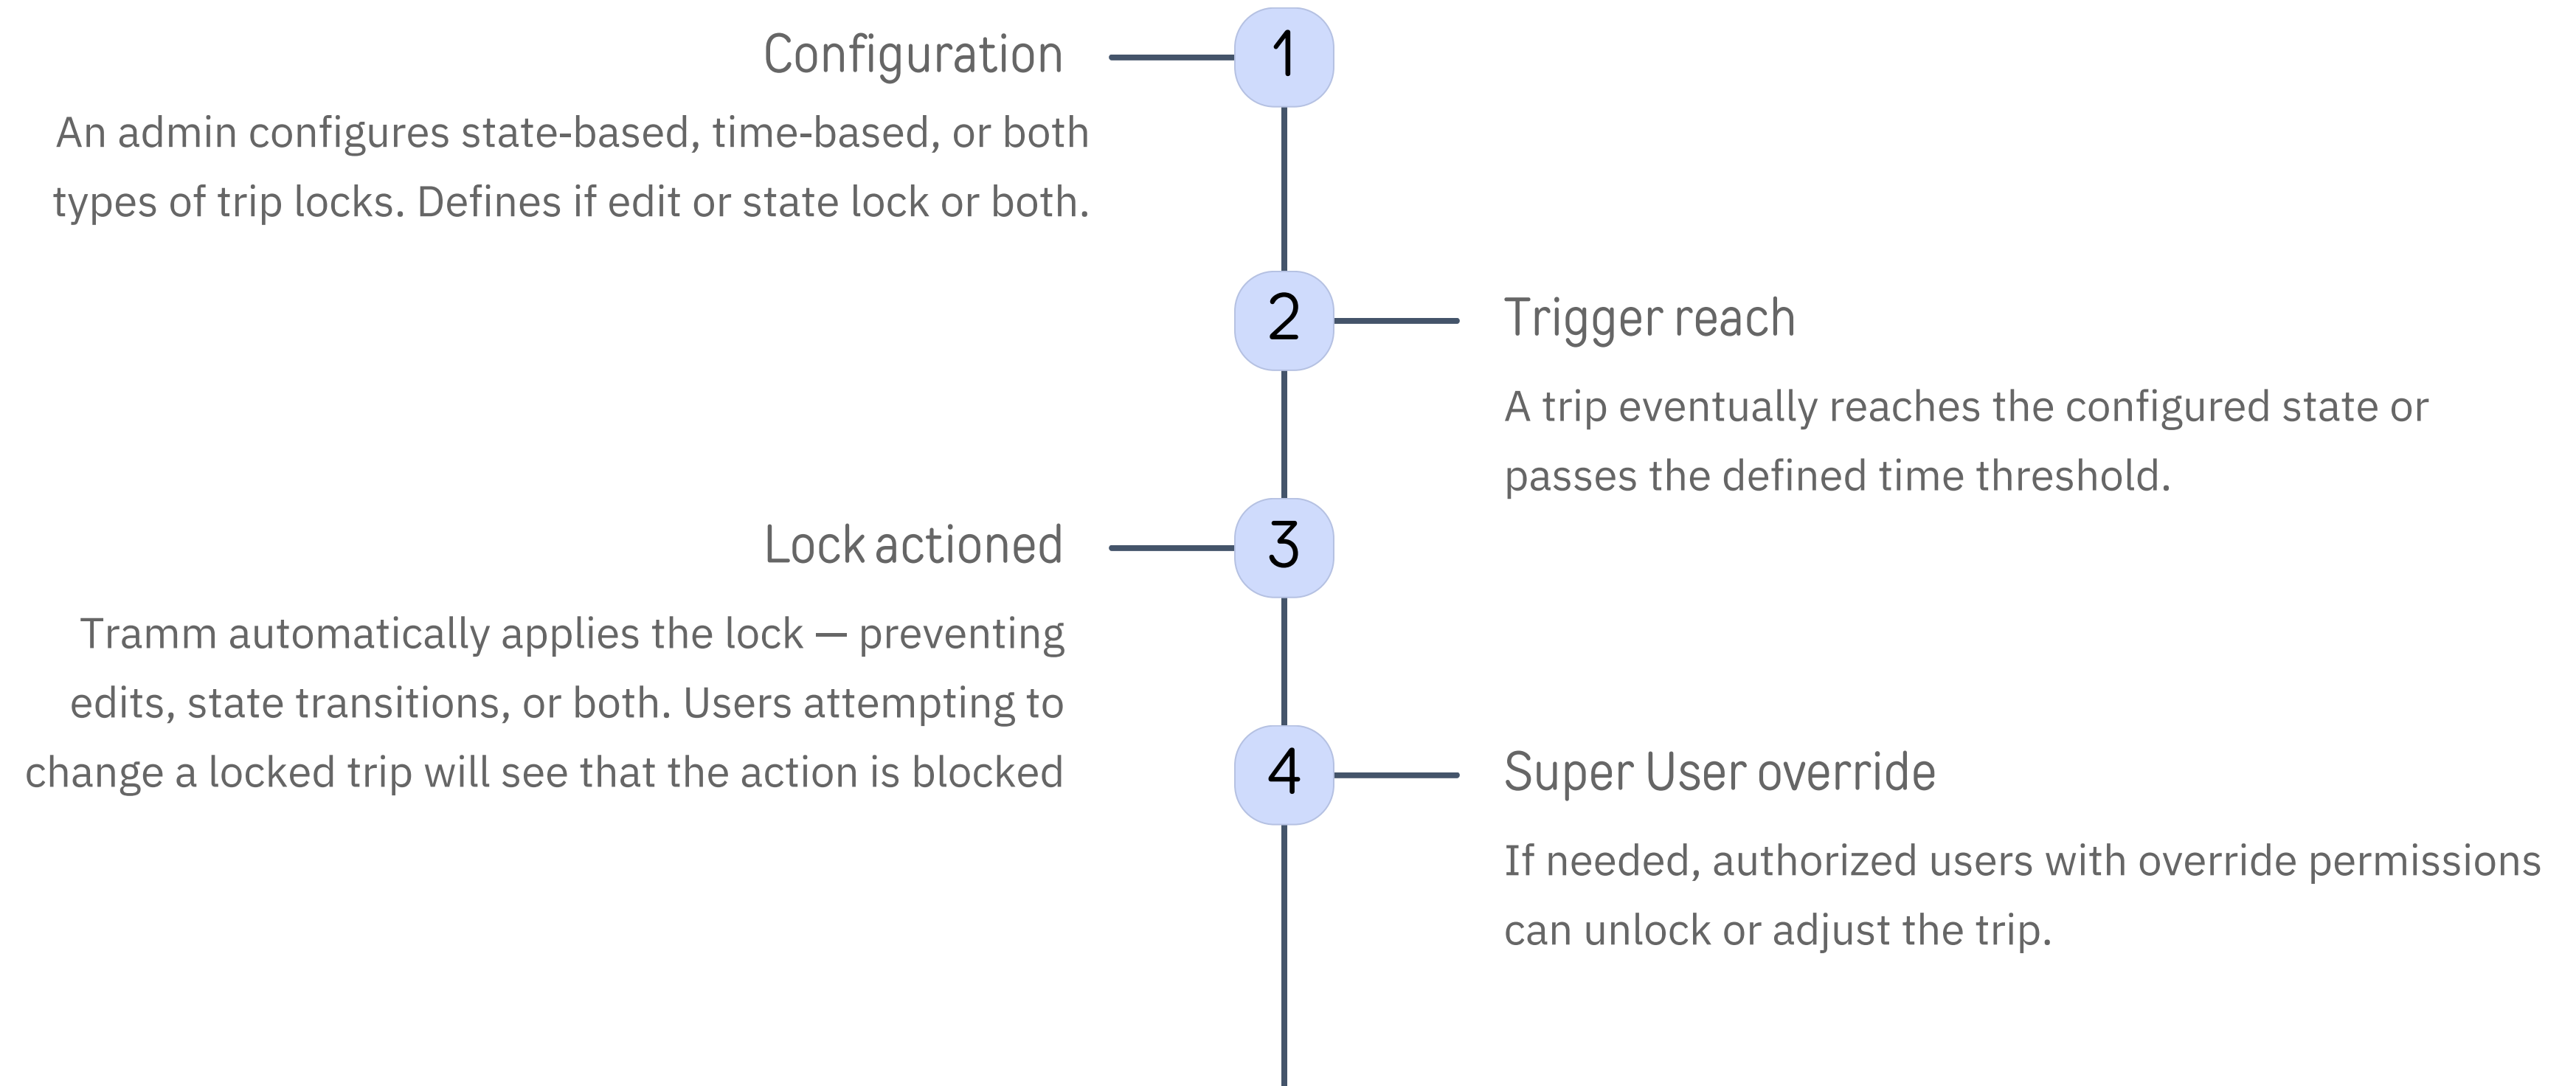

02

Added User Action Button

This gives the user the addition lock toggle button on the trip action bar. The pop-up will allow the user to override the edit lock, state lock or both by unselecting the tick box.

The Trip Lock Process

Key Benefits

1

Protects Data Integrity

Prevents accidental or unauthorized changes to finalized or old trips, that may have already been sent to other systems.

3

Reduced Errors & Rework

Stops unintended edits before they happen, keeping trip histories clean.

2

Operational Consistency

Enforces business rules by locking trips exactly when intended.

4

Controlled Flexibility

Role-based overrides ensure only the right users can unlock or adjust protected
